Rockcliff Commences Drill Program at Snow Lake Project Untested Nickel and VMS Targets to be Drilled

SUDBURY, Ontario. Rockcliff Resources Inc. (RCR: Tier 1 TSX-V) is pleased to announce that drilling has commenced at its Snow Lake Project located in central Manitoba. Rockcliff intends to complete approximately 3,000 m of drilling in a total of approximately 20 holes. A minimum total of six untested VTEM and DPEM anomalies will be tested in the program. The anomalies are associated with geological environments that are prospective for VMS and nickel mineralization.

Rockcliff's 3,000 m winter drill program will focus on new untested VTEM geophysical anomalies and on an untested DPEM anomaly all of which were identified in Rockcliff's 2008 geophysical programs completed on the project. A total of six targets, three VMS and three nickel, are planned to be drill tested in this program with approximately 20 NQ drill holes. The geophysical anomalies have continuous strike lengths of between 100 to 500 meters long.

Once assays are obtained from the lab they will be distributed to the public.

Rockcliff Resources Inc.

Rockcliff Resources Inc. is a Canadian resource exploration company focused on the Snow Lake VMS Project located in central Manitoba. The project totals in excess of 1,400 km² and is located within the prolific Flin Flon greenstone belt. The project presently includes five historical VMS deposits (Lon, Rail, Reed, Kof, Sylvia) and numerous additional areas with potential for VMS and nickel mineralization. Rockcliff also controls the Shihan VMS Project located in Northern Ontario.
